Data Structures Practical

Practical - VIII

Roll No. : S025	Name: Abhishek Pal
Class : S.Y.I.T.	Batch : 1
Date of Assignment : 12/08/2026	Date/Time of Submission : 12/08/2026

Sorting Algorithms:

Write programs to implement and compare the following sorting algorithms:

a. Bubble sort

CODE :

```
def bubbleSort(array):  
    for i in range(len(array)):  
        for j in range(0, len(array) - i - 1):  
            if array[j] > array[j + 1]:  
                temp = array[j]  
                array[j] = array[j+1]  
                array[j+1] = temp  
  
data = [-2, 45, 0, 11, -9]  
  
bubbleSort(data)  
  
print('Sorted Array in Ascending Order:')  
print(data)  
print("Abhishek_S025")
```

OUTPUT :

```
Sorted Array in Ascending Order:  
[-9, -2, 0, 11, 45]  
Abhishek_S025
```

b. Insertion sort

CODE :

```
def insertionSort(array):  
    for step in range(1, len(array)):  
        key = array[step]  
        j = step - 1  
  
        while j >= 0 and key < array[j]:  
            array[j + 1] = array[j]  
            j = j - 1  
  
        array[j + 1] = key  
  
data = [9, 5, 1, 4, 3]  
insertionSort(data)  
print('Sorted Array in Ascending Order:')  
print(data)  
print("Abhishek_S025")
```

OUTPUT :

```
Sorted Array in Ascending Order:  
[1, 3, 4, 5, 9]  
Abhishek_S025
```

c. Selection sort

CODE :

```
def selectionSort(array, size):  
    for step in range(size):  
        min_idx = step  
  
        for i in range(step + 1, size):  
            if array[i] < array[min_idx]:  
                min_idx = i  
  
        (array[step], array[min_idx]) = (array[min_idx], array[step])  
  
data = [-2, 45, 0, 11, -9]  
size = len(data)  
selectionSort(data, size)  
print('Sorted Array in Ascending Order:')  
print(data)  
print("Abhishek_S025")
```

OUTPUT :

```
Sorted Array in Ascending Order:  
[-9, -2, 0, 11, 45]  
Abhishek_S025
```
